

1. ca) Add $\begin{cases} 3ns \\ 6ns + 4ns + 5ns + 4ns = 19ns \end{cases}$

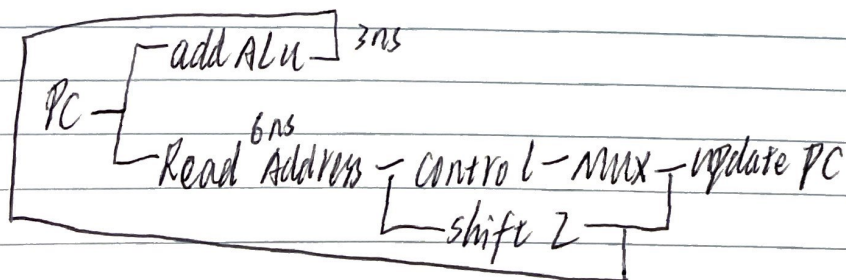

cb) lw $\begin{cases} 3ns & 3ns \\ 6ns + 4ns + 5ns + 6ns + 4ns = 28ns \end{cases}$

cc) sw $\begin{cases} 3ns \\ 6ns + 4ns + 5ns + 6ns = 21ns \end{cases}$

cd) beq $\begin{cases} 3ns + 3ns = 6ns \\ 6ns + 4ns + 5ns = 15ns \end{cases}$

ee) The system clock time should be 28ns, because 28ns is the longest time that instruction consumed.

ff) For j instruction the longest path time should be 6ns

2.a) 6 ns is the longest path time. So the system clock time should be 6 ns

$$b) \text{ add: } T_{\text{add}} = 6 \times 4 = 24 \text{ ns}$$

$$\text{lw: } T_{\text{lw}} = 5 \times 6 = 30 \text{ ns}$$

$$\text{sw: } T_{\text{sw}} = 4 \times 6 = 24 \text{ ns}$$

$$\text{beq: } T_{\text{beq}} = 5 \times 6 = 18 \text{ ns}$$

$$j: T_{\text{mj}} = 3 \times 6 = 18 \text{ ns}$$

$$T_m = 24 + 30 + 24 + 18 + 18 = 114 \text{ ns}$$

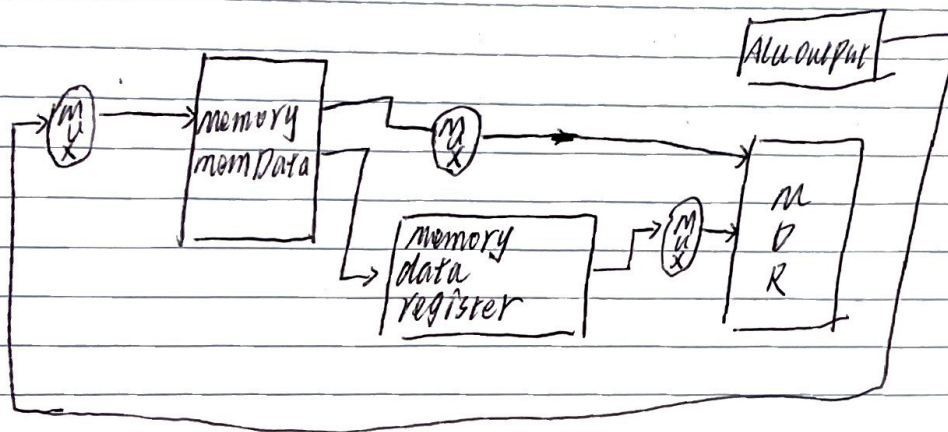

$$\text{For single cycle: } T = 30 \times 5 = 150 \text{ ns}$$

$$\text{Therefore: speed up } \frac{150}{114} \approx 1.32 \text{ times faster}$$

c)

d)

e)
